

Autoevaluation – Jaime Alejandro Luna Estrada

This first unit has been a great come back for things that we saw previously; Abstract data types are a concept difficult to get and in first instance is a little hard to understand, but with practice it becomes easier.

The most difficult for me is the last topic seen in this unit : containers, is something totally new for me and i didn't realize completely how can i implement it in my nexts personal projects.

To finish, i think my performance is 9 because the concepts of containers and the usage of dictionaries in recursive functions are hard to explain to other people for me.
